Spectroscopy Experiments Show Subtle Energy Patterns Create Changes in the Absorption Spectrum of Water Molecules

Experiments conducted in Olive W. Garvey Center, Wichita, Kansas 1993

Significant long-lasting changes in the infrared absorption spectrum of de-ionized water were observed after approximately one minute of exposure to subtle energy patterns generated by the VFT generator. The graphs below demonstrate that different Vital Force energetic imprints produce different effects on the vibrational spectrum of water.

The first graph shows the spectrum of vibrational frequencies of water molecules in the infrared range. The second graph shows how the influence of a specific subtle energy pattern changes the vibrational frequencies of water molecules. The water molecule has a triangular shape. The fact that the molecule vibrates differently means that the angle between the hydrogen and oxygen atoms has changed under the influence of a subtle energy pattern. It is still a water molecule but it has different properties!

The frequency spectrum of the molecule observed in the 3rd graph shows that under the influence of a second subtle energy pattern the water molecule vibrates in yet another way.

The significance of this experiment lies in two facts:

1. It shows that each subtle energy pattern has a unique effect on the water molecule.
2. The changes in structure of the water molecule are slight. However, the fact that the changes in the water molecule's structure do not disappear after the Subtle Energy emission is stopped, indicates that subtle energy affects water molecules quite differently than the electro-magnetic field affects them.

This experiment was repeated in the Material Research lab at Pennsylvania State University in 2004.
